Outline

- The R
- Fundementals
 - Vectors & Matrix
 - Import & Export Data
 - Probablities ,Distributions, Random Numbers
 - Descriptive Statistics & Graphs
 - Summarize
- Applications
 - Correlation & Regression Analysis
 - Clustering
 - Time Series Analysis
 - Connecting Databases With R (PL/R Examples)
 - Connecting APIs with R

The R

- R is a statistical computer program made available through the Internet under the General Public License (GPL).
- That is, it is supplied with a license that allows you to use it freely, distribute it, or even sell it, as long asthe receiver has the same rights and the source code is freely available.
- R provides an environment in which you can perform statistical analysis and produce graphics.

The R

- https://www.r-project.org/
- https://cran.r-project.org/
- https://www.rstudio.com/
- https://journal.r-project.org/
 - http://www.inside-r.org/
- http://www.r-bloggers.com/

- One of the simplest possible tasks in R is to enter an arithmetic expression and receive a result.
- > 2 + 2
- [1] 4
- $> \exp(-2)$
- [1] 0.1353353
- > x < -2
- > x
- [1] 2
- > x + x
- [1] 4

 A data vector is simply an array of numbers, and a vector variable can be constructed like this:

```
• > weight <- c(60, 72, 57, 90, 95, 72)
```

- > weight
- [1] 60 72 57 90 95 72
- The body mass index (BMI) is defined for each person as the weight in kilograms divided by the square of the height in meters. This could be calculated as follows:
- height <- c(1.75, 1.80, 1.65, 1.90, 1.74, 1.91)
- > bmi <- weight/height^2
- > bmi
- [1] 19.59184 22.22222 20.93664 24.93075 31.37799 19.73630

It's possible to concatenate vectors of more than one element as in

```
> x <- c(1, 2, 3)</li>
> y <- c(10, 20)</li>
> c(x, y, 5)
[1] 1 2 3 10 20 5
>length(c(x, y, 5))
[1] 6
```

- It is also possible to assign names to the elements. This modifies the way the vector is printed and is often used for display purposes.
- > x <- c(name="Olgun", surname="Aydin", comp="REIDIN")> x
- name surname comp
- "Olgun" "Aydin" "REIDIN"

- The second function, seq ("sequence"), is used for equidistant series of numbers.
 Writing
- > seq(4,9)
- [1] 4 5 6 7 8 9
- The integers from 4 to 9. If you want a sequence in jumps of 2, write
- > seq(4,10,2)
- [1] 4 6 8 10
- The rep function is often used for things such as group codes: If it is known that the first 10 observations are men and the last 15 are women, you can use
- > rep(1:2,c(10,15))

A convenient way to create matrices is to use the matrix function:

```
a<-matrix(1:9,3,3)</li>
> a
[,1] [,2] [,3]
[1,] 1 4 7
[2,] 2 5 8
[3,] 3 6 9
```

Product a with its transpose

```
a%*%t(a)
[,1] [,2] [,3]
[1,] 66 78 90
[2,] 78 93 108
[3,] 90 108 126
```

A convenient way to create matrices is to use the matrix function:

```
a<-matrix(1:9,3,3)</li>
> a
[,1] [,2] [,3]
[1,] 1 4 7
[2,] 2 5 8
[3,] 3 6 9
```

Product a with its transpose

```
a%*%t(a)
[,1] [,2] [,3]
[1,] 66 78 90
[2,] 78 93 108
[3,] 90 108 126
```

- Inverse of a calculated as follows:
- solve(a)
- To get dimension of matrix
- > dim(a)
- [1] 3 3
- Can "glue" vectors together, columnwise or rowwise, using the cbind and rbind functions.

```
> cbind(A=1:4,B=5:8,C=9:12)
        A B C
[1,] 1 5 9
[2,] 2 6 10
[3,] 3 7 11
[4,] 4 8 12
```

• > rbind(A=1:4,B=5:8,C=9:12)

```
[,1] [,2] [,3] [,4]
A 1 2 3 4
B 5 6 7 8
C 9 10 11 12
```

- Get working directory
- getwd()
- [1] "C:/Users/ol/Desktop"
- Set working directory
- >setwd("C:/Users/ol/Documents")
- getwd()
- [1] "C:/Users/ol/Documents"

- From A Comma Delimited Text File
- mydata <- read.table("c:/mydata.csv", header=TRUE, sep=",", row.names="id")
- From Excel
- library(xlsx)
- mydata <- read.xlsx("c:/myexcel.xlsx", sheetName=mysheet")
- From SPSS
- library(Hmisc)
- mydata <- spss.get("c:/mydata.por", use.value.labels=TRUE)

List files in working directory

```
>list.files()

• [1] "adaptive7_h200.csv"

• [2] "adaptive8_h100.csv"

• [3] "adaptive8_h250.csv"

• [4] "adaptive9_h200.csv"

• [5] "adaptive9_h200_2.csv"

• [6] "adaptive9_h300.csv"
```

- List objects in current workspace
- ls()
- [1] "a" "boundary" "data" "smry"

Show first 2 rows of the matrix

```
    > head (data, 2)
```

```
CityID CityName CountyID CountyName ActivityTypeID ActivityType PropertySubTypeID PropertySubTypeName AmountSize to_char
1 231 İstanbul 248 Kadıköy 11 Sales 119 Office 6141.429 2015
2 231 İstanbul 248 Kadıköy 11 Sales 119 Office 5646.226 2015
```

Show coloumn names of matrix

```
>colnames (data)
```

```
    [1] "CityID" "CityName" "CountyID" "CountyName" "ActivityTypeID"
    [6] "ActivityType" "PropertySubTypeID" "PropertySubTypeName" "AmountSize" "to_char"
```

Show first 2 rows of "AmountSize" coloumn

- head(data\$AmountSize,2)
- [1] 6141.429 5646.226

• In R, you can simulate these situations with the sample function. If you want to pick five numbers at random from the set 1:40, then you can write

```
> sample(1:40,5)[1] 4 30 28 40 13
```

• There are five possibilities for the first number, and for each of these there are four possibilities for the second, and so forth; that is, the number is $5 \times 4 \times 3 \times 2 \times 1$. This number is also written as 5! (5 factorial).

```
>prod(5:1)
```

• [1] 120

- So all we need to do is to calculate the number of ways to choose 5 numbers out of 40.
- > 1/choose(40,5)
- [1] 1.519738e-06
- way of creating the plot is to use curve as follows:
- > curve (dnorm(x), from=-4, to=4)
- For discrete distributions, where variables can take on only distinct values, it is preferable to draw a pin diagram, here for the binomial distribution with n=50 and p=0.33
- \bullet > x <- 0:50
- > plot(x,dbinom(x,size=50,prob=.33),type="h")

Say that it is known that some biochemical measure in healthy individuals is well
described by a normal distribution with a mean of 132 and a standard deviation of
13. Then, if a patient has a value of 160, there is

```
> 1-pnorm(160, mean=132, sd=13)
```

• [1] 0.01562612

- The use of the functions that generate random numbers is straightforward. The first
 argument specifies the number of random numbers to compute, and the bsequent
 arguments are similar to those for other functions related to the same distributions.
 For instance,
- > rnorm(10)
- [1] -0.2996466 -0.1718510 -0.1955634 1.2280843 -2.6074190
- [6] -0.2999453 -0.4655102 -1.5680666 1.2545876 -1.8028839
- > rnorm(10, mean=7, sd=5)
- [1] 8.934983 8.611855 4.675578 3.670129 4.223117 5.484290
- [7] 12.141946 8.057541 -2.893164 13.590586
- > rbinom(10, size=20, prob=.5)
- [1] 12 11 10 8 11 8 11 8 8 13

• It is easy to calculate simple summary statistics with R. Here is how to calculate the mean, standard deviation, variance, and median.

```
\cdot > x <- rnorm(50)
```

- \bullet > mean(x)
- [1] 0.03301363
- \bullet > sd(x)
- [1] 1.069454
- > var(x)
- [1] 1.143731
- \bullet > median(x)
- [1] -0.08682795

Empirical quantiles may be obtained with the function quantile like this:

```
>quantile(data$AmountSize)
```

```
• 0% 25% 50% 75% 100%
```

• 0.5685 360.5000 588.4818 929.3559 33636.3636

Summary statistics

- >summary(data\$AmountSize)
- Min. 1st Qu. Median Mean 3rd Qu. Max.
- 0.57 360.50 588.50 792.80 929.40 33640.00

- Empirical quantiles may be obtained with the function quantile like this:
- >quantile(data\$AmountSize)

```
    0% 25% 50% 75% 100%
    0.5685 360.5000 588.4818 929.3559 33636.3636
```

Summary statistics

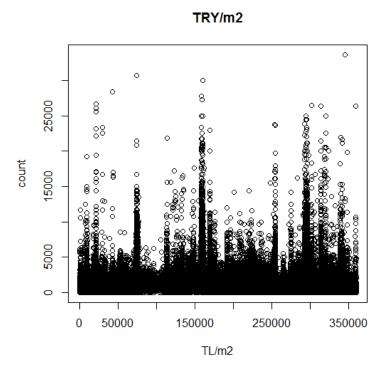

>summary(data\$AmountSize)

```
    Min. 1st Qu. Median Mean 3rd Qu. Max.
    0.57 360.50 588.50 792.80 929.40 33640.00
```

- Learn how many rows of AmountSize less than 1000 USD
- > length(data\$AmountSize[data\$AmountSize<1000])
- [1] 281621

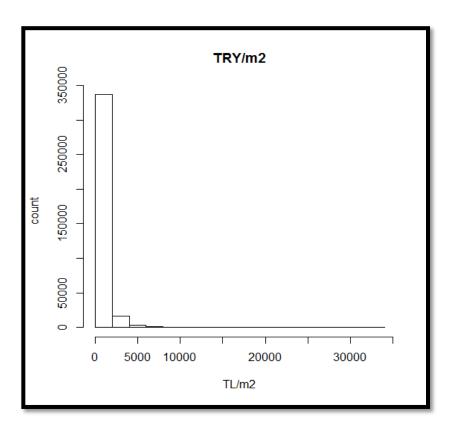

Draw plot of AmountSize

>plot(data\$AmountSize,main="TRY/m2",xlab="TL/m2",ylab="count")

Draw histogram of AmountSize

>hist(data\$AmountSize,main="TRY/m2",xlab="TL/m2",ylab="count")

Summarize

• The doBy package provides much of the functionality of SAS PROC SUMMARY. It defines the desired table using a model formula and a function. Here is a simple example.

```
>library(doBy)
>summaryBy(mpg + wt ~ cyl + vs, data = mtcars, FUN = function(x) { c(m = mean(x), s = sd(x)) } )
```

Summarize

```
boundary<- function(x)</pre>
Pricetran<-log(x)</pre>
meantdata<-mean(Pricetran)</pre>
stdtdata<-sd(Pricetran)</pre>
skw<-skewness(x)
kurt<-kurtosis(x)</pre>
UpB 2 51<-exp (meantdata+2.51*stdtdata)</pre>
LoB 2 51<-exp(meantdata-2.51*stdtdata)
return(c(skw,kurt,LoB 2 51,UpB 2 51)
smrv <-
  summaryBy (AmountSize~CityID+CityName+CountyID+CountyName+ActivityTypeID+Activ
  ityType+PropertySubTypeName, FUN=boundary, data=data)
```

Applications

- Correlation & Regression Analysis
- Clustering
- Time Series Analysis
- Connecting Databases With R (PL/R Examples)
- Connecting APIs with R
